

Your list of changes and questions

Where each stands, what I would do, and a rough build estimate.

From Arvind Nanda

1. Default billing

New leases default to Canadian dollars, monthly, net 30. You cannot save a lease with no rate; once a rate is in, it bills the cheaper option for the rental length. These defaults are in the code, not on a screen.

Question — leave the default as Canadian dollars / monthly / net 30, or make it changeable on a settings screen?

Estimate — 1–2 hours to make it configurable.

2. Customer dashboard

- **o/2 on leases** — shows active over total, but the “active” figure is a stale counter that never updates. Fix it to a live count and label it clearly. (*est. ~1 hr*)
- **What customers see** — in the portal they only see company name, terms, balance, currency and their own records. Nothing internal (risk, notes, credit limit, discounts, tags) is exposed. (*no change needed*)
- **Identity section** — it holds the only required field (company name) and feeds other screens, so it cannot be removed whole. **Question:** which fields do you want off it? (*est. ~1 hr*)
- **Status colour** — it is colour-coded by status today. **Question:** plain black, or just darkened so it reads better? (*est. ~1 hr*)

3. Credit application

Fully working today: secure link to the customer, they sign online, staff approve or decline and can set a credit limit and status. Two gaps against your process: there is no “credit check required” checkbox, and the email cannot CC Rachit. Setting a customer to Active also does not currently control whether we can rent to them (see item 4).

Recommend — add the checkbox and the CC to Rachit; gate rentals on status via item 4.

Estimate — 1–2 hours for the checkbox and CC.

4. Suspended

Marking a customer Suspended stops nothing in the office app: you can still open a lease, invoice, and take a payment. It only blocks that customer from the online portal.

Recommend — make Suspended, Inactive and Pending block a new lease, and Credit Hold warn with a manager override. That gives the SOP something concrete to describe.

Estimate — 2–2.5 hours.

5. Risk level

Low / Medium / High plus notes, set by hand or by a nightly job. It is only a flag today; it does not change billing or block anything, so the team can define the levels however you like.

Question — want me to write up the thresholds the nightly job already uses as a starting point for the meeting, and should High actually trigger something (deposit, booking warning)?

Estimate — thresholds write-up about 1 hour; making High trigger an action 3–6 hours.

6. Equipment – make and brand

There is one manufacturer field (“Brand / Make”); the two dropdowns are Equipment Type and Brand / Make, so this is really “pick the type, then show only its brands.” Two things: a real bug where old spec values do not clear when you change type, and no link in the database between types and brands, which the filtering needs first.

Question — confirm you mean the type filtering the brand list, and that you are okay adding a type-to-brand mapping behind it.

Estimate — bug fix 1–2 hours; brand filtering 6–10 hours.

7. CVI notifications

Nightly check, 30 days ahead. Staff get an in-app alert, and the only email goes to the customer (and currently includes insurance).

Recommend — send to one service address (service@mainlandtts.ca), weekly, covering this month plus all of next month, with overdue flagged.

Question — your note cut off: overdue items flagged in the same email, or in their own section?

Estimate — 3–4 hours.

8. Rates

- **Estimated mileage** — lives on the lease today. Add it to the rate card so leases inherit it. *(est. 3–5 hrs)*
- **Standard card rates** — rate cards already hold daily, weekly, monthly and mileage (plus hourly and GPS), with a company-wide standard card and per-customer overrides. What is missing is editing in place. Recommend a dedicated screen with inline editing. *(est. 6–10 hrs)*
- **GSP** — there is no “GSP” in the system; you almost certainly mean GPS, which already exists on the rate card. Confirm and we reuse it. *(no build)*
- **Rounding** — money already rounds to the cent in billing; there is no single rule when a rate is typed in. **Question:** what is the standard (cent, mileage decimals, nearest dollar)? *(est. 1–2 hrs)*

9. Lease management

- **Batch invoicing** — does not exist yet. Build a screen to pick customers and a period and generate invoices across them. *(est. 10–16 hrs)*
- **Insurance, client copy** — stop the customer copy and route it to the service address with the CVI change above. *(folds into item 7)*
- **Insurance, after upload** — nothing emails on upload today, and there is no separate first name stored. Build the auto-email to the client using your wording. *(est. 4–6 hrs)*
- **End-of-month report** — the data is there but there is no report or export. Build a dedicated Active Leases report, auto-emailed monthly. *(est. 5–8 hrs)*
- **Start-of-month report** — the scheduled-email machinery already exists. **Question:** what should be on it? *(est. 4–6 hrs)*
